I'm aware that you spend a lot of energy, if not time, managing your investments. I'm throwing an opportunity your way, completely unaware of your risk appetite and with absolutely no expectation attached. I've been helping a cancer therapeutic startup biotech, and we're raising an initial round of funding to convert the science into a real drug. Two documents describing the opportunity are attached. If you are at all intrigued, let's set up a time to talk after Jan 1.

In short, I've been working with a young researcher at the University of Rochester who has identified a novel cancer chemotherapy target and built science around it that has the potential to be the foundation of a new class of drugs. We are trying to raise a small investment fund to design and build the lead drug candidate, the crucial next step to converting the science into a medicine.

I've attached two pitch documents. If this is at all intriguing, let me know and we can arrange an opportunity to talk about it.

Over the last nine months I've been working with a young researcher at the University of Rochester who has elucidated the role of a novel target in cancer cell survival. He's evolved this science into a company whose aim is a new class of anticancer medicines.

We're now seeking to raise a small investment round to create lead candidates for a drug, obtain patent protection, and prepare for IND enabling studies - the work necessary to kick off creating a drug. The work is described in the two attached files.

I have no idea of your interest in this kind of thing, either for its science or as an investment, but I thought I'd throw it your way in case it piques your interest. If it does, I'd be happy to meet up and talk about it.
